Executive summary

This document contains the release notes for D-GEO-Suite Stability.
### About Deltares

Deltares is an independent institute for applied research in the field of water and subsurface. Throughout the world, we work on smart solutions, innovations and applications for people, environment and society. Our main focus is on deltas, coastal regions and river basins. Managing these densely populated and vulnerable areas is complex, which is why we work closely with governments, businesses, other research institutes and universities at home and abroad. Our motto is ‘Enabling Delta Life’.

As an applied research institute, the success of Deltares can be measured in the extent to which our expert knowledge can be used in and for society. As Deltares we aim at excellence in our expertise and advice, where we always take the consequences of our results for environment and society into consideration.

All contracts and projects contribute to the consolidation of our knowledge base. We look from a long-term perspective at contributions to the solutions for now. We believe in openness and transparency, as is evident from the free availability of our software and models. Open source works, is our firm conviction.

Deltares is based in Delft and Utrecht, the Netherlands. We employ over 800 people who represent some 40 nationalities. We have branch and project offices in Australia, Indonesia, New Zealand, the Philippines, Singapore, the United Arab Emirates and Vietnam. In the USA Deltares also has an affiliated organization.

# Purpose and scope of this document

This document lists all new features released in each version of D-Stability. It helps the user to find new functionality or see when old functionality was implemented.
2 Version history

2.1 Version 1.0.0

Strength models
• Mohr Coulomb
• SHANSEP

Limit equilibrium models
• Bishop
• Uplift-Van
• Spencer

Calculate safety factor
• Deterministic

Building stages for SHANSEP yield stress administration with yield as state parameter

Ground improvement techniques
• Forbidden line
• Geo textile
• Nails

Loads
• Uniform
• Line
• Tree on slope
• Earthquake

2.2 Version 1.1.0

Updates contain:
• Updated licence conditions
• Full Probabilistic functionality (beta)
• Proper volumetric weight used below phreatic line
• Head lines are considered besides the line
• Batch functionality through user interface and console
• Import more information from .sti file
• Shadings visible in Geometry
• Improved labelling
• Delete state points and lines
### 2.3 Version 2020.01

The probabilistic features are in beta. All (non-)probabilistic features are carefully tested. Most, but not all features are covered by unit tests. Please be careful when using (earthquake) loads in combinations with Spencer, as there are no unit tests to verify the numeric result.

- Driving moment due to a load is now properly taken into account
- Included support to Helpdesk Water
- Extended undo/redo functionality
- Improved visibility reference lines in water tab
- Simplified assigning water lines to reference lines
- Checksum on input file, feedback in project info
- Removed inactive buttons

### 2.4 Version 2020.02

The probabilistic features remain in beta. All (non-)probabilistic features are carefully tested. Most, but not all features are covered by unit tests. Please be careful when using (earthquake) loads in combinations with Spencer, as there are no unit tests to verify the numeric result.

- Update version numbering to align with the D-HYDRO Suite
- Fixed bug upon start up when D-Stability says the license has expired.
- Fixed bug in the pre-processor to convert yield or OCR tot POP.
- Fixed bug in saving after splitting a layer with a state point with correlation.
- Fixed bug that excavation is not cut out after making a new construction phase.
- Points can be added on a water and reference lines.
- Unit weight of water is a variable.
- Alpha values of POP of previous stages are shown in the result inspector.
- Shadings and colour picker in material inspector is added.
- The location of the centre of the slip plane is shown while moving the search area for Bishop and Uplift-Van.
- Materials can be assigned to multiple layers at once.
- Improved refreshing of canvas after undo/redo.
- Updated to the latest version of the MacroStability kernel. This update will not cause any different results.
- Updated to the latest version of the Reliability library. This improves the stability of probabilistic calculations and can therefore lead to different results. Note that this new version is still in beta.

### 2.5 Version 2020.03

The probabilistic features remain in beta. All (non-)probabilistic features are carefully tested. Most, but not all features are covered by unit tests. Please be careful when using (earthquake) loads in combinations with Spencer, as there are no unit tests to verify the numeric result.

- SU table (undrained) material model is implemented
- Improved feedback in console
- Delete material by right mouse click in materials list
- Application info to show source of .stix file
- Improved “Last modified by”
- Fixed bug that the Uplift-Van tangent line can move above the surface line during search
- Improved feedback while dragging search area
• Prompt to save changes after undo/redo
• Updated to latest version of MacroStability API

2.6 Version 2021.01
The probabilistic features remain in beta. All (non-)probabilistic features are carefully tested. Most, but not all features are covered by unit tests. Please be careful when using (earthquake) loads in combinations with Spencer, as there are no unit tests to verify the numeric result.
• Enable import D-Geo Stability 18.2 (old .sti format)
3 New in version 2021.02

- Update to the probability library version 21.1.1.
- Export fragility curve to JSON format
- Show uncorrelated alpha’s in user interface (required values for HydraRing)
- Fixed bug: improved reliability of kernel with vertical layer boundaries.
- Fixed bug: allow for two Uplift-Van circles with the same x-coordinate
- Move waternet creator to a separate kernel in preparation for a groundwater flow product

Please be careful when using (earthquake) loads in combinations with Spencer, as there are no unit tests to verify the numeric result.
